CSS Task 4 - Box Model

Understanding CSS Box Model with Padding, Border, Width and Height

1. OBJECTIVE
The objective of this task was to understand the CSS Box Model and to observe how Padding, Border, Width and Height affect the total size of an element.

2. WHAT IS BOX MODEL?
In CSS, every element is considered as a box. The Box Model consists of:
- Content: The actual text or image inside the box.
- Padding: The space between the content and the border.
- Border: The line around the padding and content.
- Margin: The space outside the border, between two elements.

3. BOX 1 - Default (content-box)
Width 200px, Height 150px, Padding 20px, Border 5px solid.
Total Width = 200 + 20 + 20 + 5 + 5 = 250px
Total Height = 150 + 20 + 20 + 5 + 5 = 200px
Observation: Box becomes bigger because padding and border are added outside.

4. BOX 2 - border-box
Width 200px, Height 150px, Padding 20px, Border 5px, box-sizing: border-box.
Total Width = 200px (fixed) | Total Height = 150px (fixed)
Observation: Total size remains same. Padding and border adjust inside.
This is better for layout design.

5. BOX 3 - Different Values
Width 250px, Height 200px, Padding 40px 10px, Border 10px dashed.
Total Width = 250px (fixed) | Total Height = 200px (fixed)
Observation: Padding can be different for top-bottom and left-right.
Same rule applies to height as well as width.

6. CONCLUSION
Default box model (content-box) increases total size, while border-box keeps size fixed. For better control, box-sizing: border-box should be used. This task helped to understand how padding, border, width and height work together in CSS.
